

NeuroFit for Cognitive Performance at Work

Abstract: How integrated physical■cognitive training improves focus, stress tolerance, and productivity, and how to pilot NeuroFit in a small team within 30 days.

The Problem

Rising cognitive load and sedentary behaviour reduce attention and output. Standard wellness perks lack measurable impact.

The Science Signal

Exercise elevates neurotrophic factors; attention training improves task■switch efficiency. Combined protocols improve adherence and transfer.

The NeuroFit Method

Five sessions/week, 45–60 min, with 2–3 min cognitive drills. No■equipment and minimal■kit tracks.

Pilot in 30 Days

Week 0: Baseline metrics (attention, 12■min step/walk test, stress survey). Weeks 1–3: Programme rollout with workbook tracking. Week 4: Post■test and ROI snapshot.

KPIs & ROI

Attendance $\geq 70\%$; Attention +10–20%; MVPA +20–40%; Stress –10–20%.

Implementation

Privacy■first data collection; anonymised dashboards. Accessibility and inclusion notes.

Call to Action

Start a 10■seat pilot. Email corporate@neurofit.example.
